

A Custom Designed Advantage

Unlike modified generic equipment, a custom-designed system is designed for specific parts and specific processes. Some companies will take one of their standard off-the-shelf machines and add, subtract or alter it slightly so it will work for your situation. Because we custom build every machine to your specific need, we can guarantee the finish of each part and greatly increase your process output while maintaining repeatability and reliability. Most of our customers understand that quality control and part rework is a significant overhead cost. Custom-designed systems greatly reduce this cost while increasing output. Surface Blasting Systems' value-added machinery is a significant increase in your production efficiency and lower process costs.
